GUIDE

Mistakes are fixed by whoever makes them

Your client signs up their own students without touching site administration — and without a support ticket for every mistyped email.

1 What is it and what is it for?

Class Manager lets a client's manager —enrolled in their course with the **Class manager** role— sign up their students, enrol them and follow them up **only within their course**. The plugin creates the accounts, generates the usernames, writes the ID document to the profile, enrols, assigns groups and sends the welcome emails. The administrator steps in once per client; the day-to-day work belongs to the manager.

Built for traceable training

The ID document feeds the reports of other eLearning Fácil plugins such as local_efreport (time and progress) and local_efcomms (communications); make it mandatory in the site settings (§3) when your training records must identify each student. Generic passwords are never used: every student creates their own, so the recorded time belongs to the person it claims to.

2 Who does what

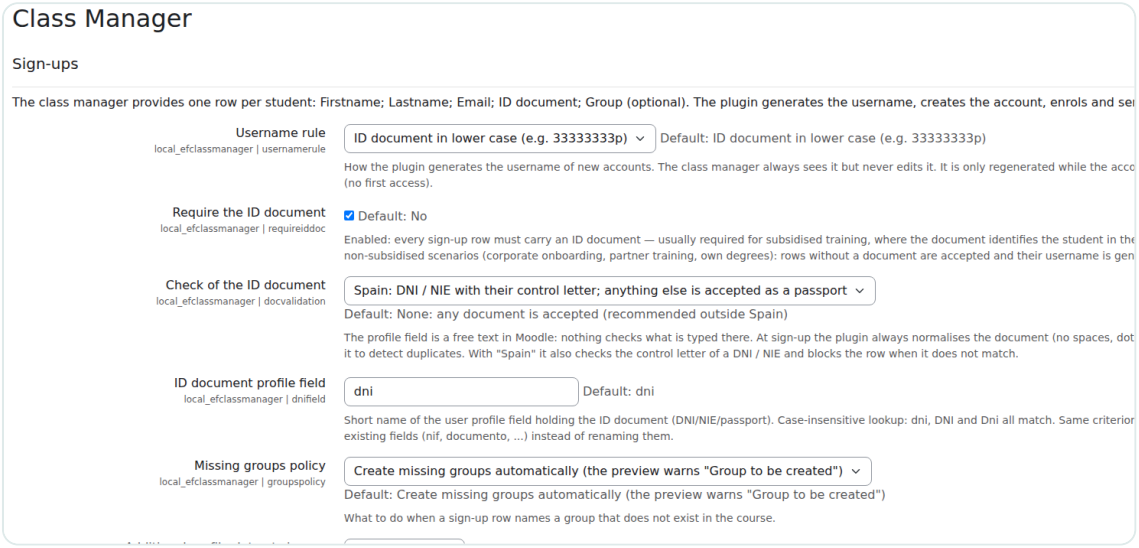

Who	What they do	When
Administrator	Installs the plugin, duplicates the template course, creates the manager's account and enrols them as "Class manager", sets the seats.	Once per client (~10 min)
Class manager	Signs up their students, fixes mistakes, resends welcome emails, suspends or removes students, checks the panel and the history.	Day to day
Student	Receives the welcome email, creates their password with a single-use link and enters the course.	Their first day

THE COURSE IS THE SCOPE

There are no "organisations" to administer: the manager's scope is the courses where they hold the role. Moodle's own course context keeps clients apart.

3 Installation and site settings

1. First **back up your site** (database, moodledata and code), as with any plugin.
2. Upload the ZIP in **Site administration → Plugins → Install plugins** and confirm. The **Class manager** role is created automatically (§4).
3. Review the settings in **Site administration → Plugins → Local plugins → Class Manager**.
4. In **Site administration → Reports → System checks**, check the integrity of the installation and the role.

The top of the global settings: username rule, ID document, groups policy and **additional profile data** asked for at sign-up. Further down are the seats, the access period, the welcome email and its templates.

The settings worth deciding on day one

- **ID document profile field**: short name of the field where your site stores the document (`dni` , `DNI` , `nif` … the lookup is case-insensitive). The same criterion that local_efreport uses.
- **Maximum emails per hour**: set it below your hosting limit (with 100/h, use 90). Accounts are created instantly; only the emails are spread out.
- **Username rule**: ID document in lower case (default) or full email address.
- **Require the ID document**: off on new installations (sites that already had it keep their value). Turn it on when the document must identify the student in your records or reports. With it off (corporate onboarding, partner training, own qualifications), rows without a document are accepted, their username is generated from the email, nothing is written to the profile and the preview flags them with “No ID document”. Each course can also set it (§5): “As the site”, yes or no.
- **Check of the ID document**: **None** (default) or **Spain**. Good to know: the profile field is **free text** in Moodle™; nothing checks what is typed there. At sign-up the plugin **normalises** the document (removes spaces, dots and dashes and turns it into upper case: “12.345.678-5” and “123456785” are the same) and uses it to detect duplicates; that is what any country needs, and with “None” any document is accepted. The optional “Spain” check also verifies the **control letter** of a Spanish DNI / NIE and blocks the row

when it does not match (any other document is accepted as a passport). Sites that already used the plugin keep “Spain”.

- **Welcome mode**: a single-use link to create the password (Mode A, recommended) or an individual random password with a forced change (Mode B).
- **Additional profile data at sign-up** and which of them are mandatory (§6): institution, phone, your own profile fields… None by default.
- **Default seats per course** and how they are counted, and the **default access period** of the students (§5).
- **Whether to send the welcome email** and the **Reply-to address** (§8).
- **Support address for the students**, **support sentence** and **sign-off** of the welcome emails (§8): what students read at the end of the email. Also course by course.

Almost everything above can also be decided **course by course** (§5): whatever the course does not change uses the site value.

THREE RECOMMENDED MOODLE™ SETTINGS

authloginviaemail (students log in with their email or username) · **emailchangeconfirmation** (a later email change is confirmed by the student) · **pwresettime** (how long the create-password link is valid; raise it from 30 min to 4–24 h so the student has time).

AVOID DUPLICATE EMAILS

Since Moodle™ 4.4 manual enrolment can send its own course welcome message. If you use this plugin’s welcome emails, turn off **Send course welcome message** in the manual enrolment settings.

4 The “Class manager” role

The plugin **creates the role by itself when it is installed for the first time**: short name `classmanager`, named after the language of the site (“Class manager” on an English site), no archetype and assignable in courses only. There is nothing to import.

- **If you already had the role** from an earlier version (`classmanager` or `gestoraula`), the plugin does not create another one or touch yours.
- **Updates never change it**: you can rename it or adjust its permissions. If a version ever needs a new permission, its change log will say so.
- **If you delete it** or want it on another site: in the plugin settings, section “Class manager role”, download the preset (`classmanager.xml`) and import it in **Site administration → Users → Permissions → Define roles → Add a new role**. To bring an existing role back to the preset, use **Reset** with the XML and untick **Short name** and **Full name** (never delete and recreate it: you would lose the assignments).
- **Reports → System checks** warns when the role is missing, cannot be assigned in courses or lacks a permission.

Can	Cannot
Sign up and enrol students in THEIR course	See or touch other courses
Correct the email (before the lock, only accounts created by the sign-up) and the ID document (always, with an audit trail)	Edit usernames or touch the email of an account that already existed
Resend welcome emails, suspend/reactivate, remove from course	Delete accounts (never; evidence is kept)
Manage the groups of their course	Create teachers or assign roles
See their panel and their history	Change seats or templates (that is the administrator’s job)
	Enter site administration

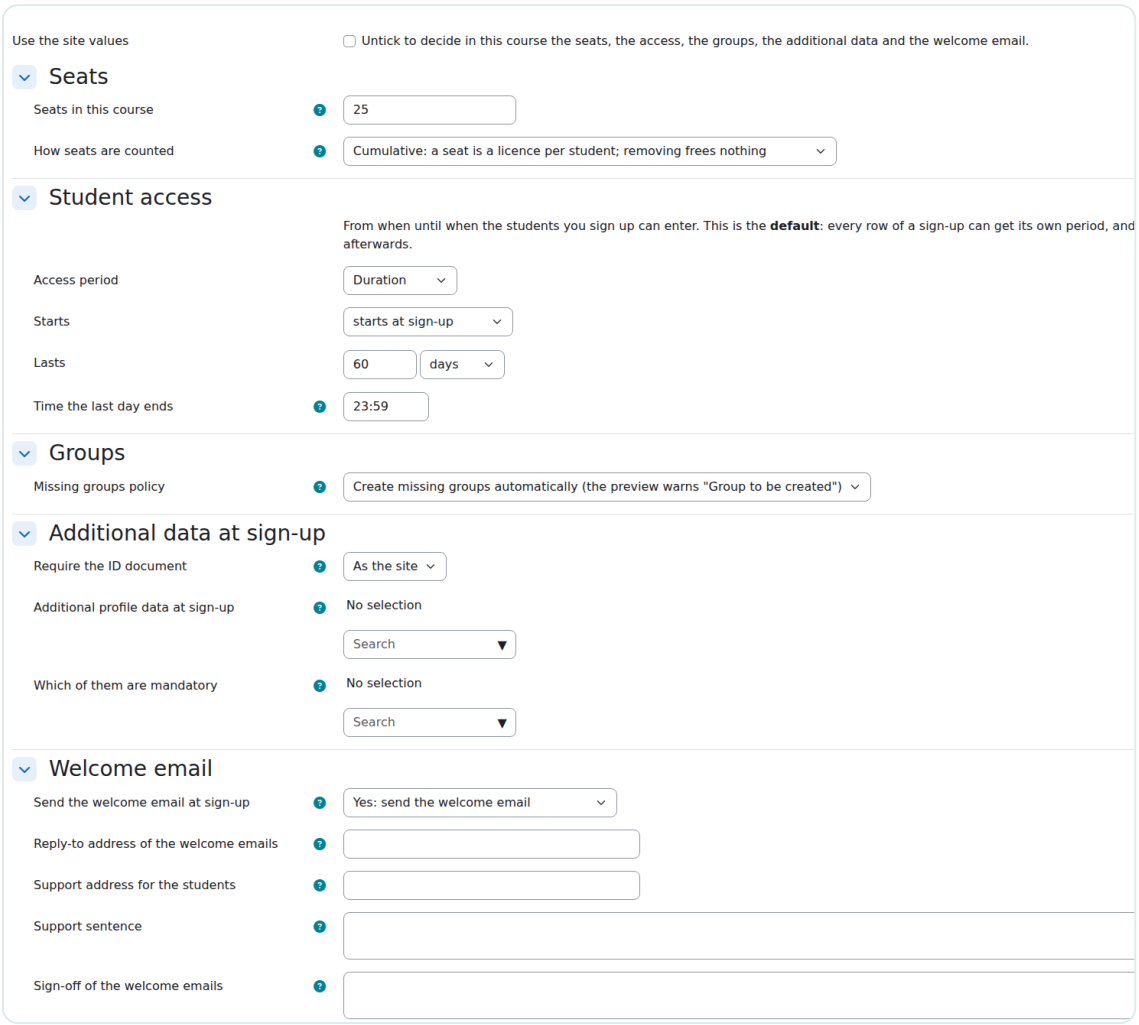

SETTING UP A NEW CLIENT, STEP BY STEP

Duplicate the template course → create the manager’s account → enrol them in the course with the **Class manager** role → set the seats (§5). Done: the client is now autonomous.

5 Preparing a client's classroom

With the configuration capability (administrator or manager), in the course: **More → Sign-up configuration (seats, access and templates)**. Five sections —seats, student access, groups, additional data at sign-up and welcome email—; anything you do not touch uses the site values.

> **WHERE ARE THE MENU ENTRIES?**
>
> With this plugin alone, "Sign-ups and enrolment", "My students", "Action history" and "Sign-up configuration" are in the course's **More** menu. If other eLearning Fácil plugins such as local_efreport are installed, they are grouped together under **More → Training management**, with the rest of the course tools.

Untick "Use the site values" to decide in this course the **seats** and how they are counted, the student **access**, what to do with **groups** that do not exist, the **additional data** at sign-up and the **welcome email** (whether it is sent, where the replies go and, further down, templates of its own for the course).

Seats: how they are counted

Mode	A seat is…	Removing a student	What it is for
Cumulative (default)	A licence per student: every person signed up consumes a seat for good.	Frees nothing	Selling seats: “10 seats” means 10 people, full stop. Readmitting the same person consumes no new seat.
Concurrent	A place in the classroom: enrolled students count, active and suspended.	Frees it	Rolling classrooms: students who come and go.

Student access (with time of day)

This is the **default** value for the sign-ups of that course. Each sign-up can change it row by row (§6) and, later, from the panel (§10). Three modes:

Mode	Starts	Ends
No end date	At sign-up, or on the date and time you set (you can enrol today and have access start tomorrow).	Never.
Duration	The same.	N days, weeks or months later, at the time you configure (23:59 by default). These are calendar days: a daylight saving change does not move the time you wrote.
Fixed dates	A fixed date and time.	A fixed date and time. The “Copy the course dates” button takes Moodle’s course dates or, if present, the `fecha_inicio` / `fecha_final` course fields of the eLearning Fácil suite.

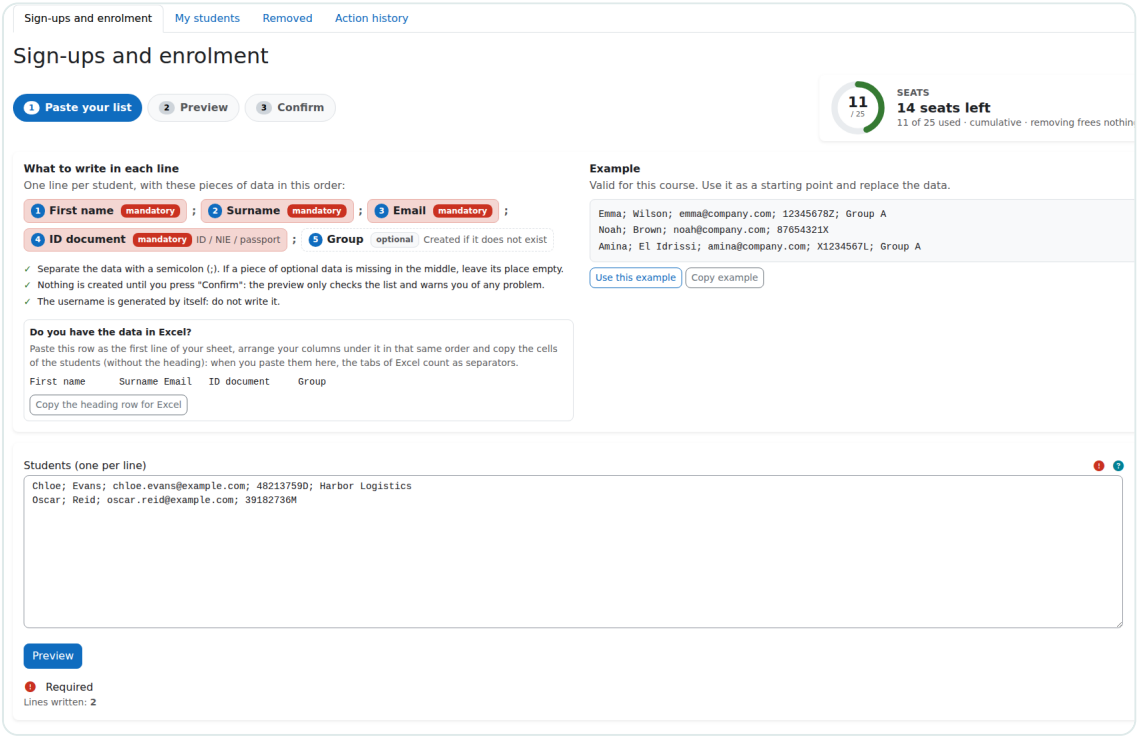

> **TIMES ARE IN YOUR TIMEZONE**
>
> Dates and times are calculated in the manager’s timezone, the one shown on screen; the student sees them in theirs. An access that ends “on 30/09 at 23:59” ends at that time on the manager’s clock.

- The manager **sees** the seats (“Seats: 7 of 10 used · cumulative”) but cannot change them.
- Course templates override the site templates; if they are empty, the global ones are used (and failing those, the plugin’s built-in texts).

6 Signing up students: the list and the preview

The manager goes to their course: **More → Sign-ups and enrolment**. The page guides them step by step, no technical knowledge needed:

- At the top, the **three steps** (Paste your list → Preview → Confirm) and the course **seats** in a ring: used, total and how many are left.
- **"What to write in each line"**: a numbered box for each piece of data, in order, saying which is **mandatory** and which is **optional** (in words, not just by colour), with its format or options underneath: ID / NIE / passport, the options of a menu, Yes / No, dates as dd/mm/yyyy or yyyy-mm-dd, the country by its code or its name.
- An **example valid for that course**: "Use this example" puts it in the box for you to edit; "Copy example" copies it.
- **Do you have the data in Excel?** A button copies the **heading row** with the columns in the exact order of this course: paste it as the first row of your sheet, arrange your columns under it, copy the students' cells (without the heading) and paste them here as they are: Excel's **tabs** count as separators, just like the semicolon.
- The list box, full width, counts the lines written.

One line per student: **First name; Surname; Email; ID document; Group** (the group is optional), separated by semicolons. For example: **Emma; Wilson; emma@company.com; 12345678Z; Group A** .

Preview checks the list **without creating anything** and warns you of everything before you confirm:

#	Student	Email	ID document	Username	Group	Access	Result
1	James Carter	james.carter@example.com	52364810C	52364810c	—		Already enrolled in this course
2	Lucas Martin	lucas.martin@example.com	12345678A	—	—	13/10/26, 13:47 → 11/12/26, 23:59	Invalid DNI/NIE (check letter mismatch)
3	Sofia Rossi	sofia.rossi@example.com	PAS778899	pas778899	Northside Clinic	13/10/26, 13:47 → 11/12/26, 23:59	Passport / foreign document (accepted) · New account · Group to be created: Northside Clinic
4	Hannah Schmidt	hannah.schmidt@example.com	17320508J	17320508j	—	13/10/26, 13:47 → 11/12/26, 23:59	New account

Each row with its result: a student already enrolled, a DNI/NIE with the wrong letter (blocked), a passport (accepted, with a notice) and a "Group to be created", and new accounts.

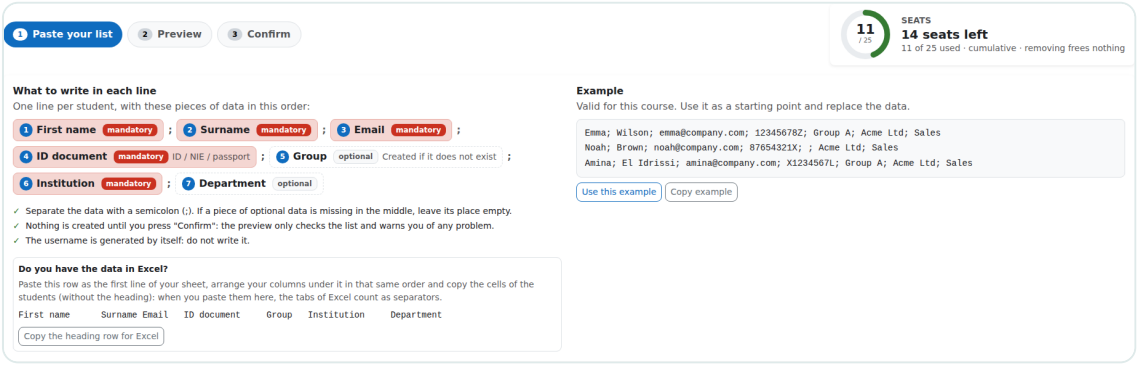

Result	What it means
New account	All correct: the account will be created with the generated username (shown in the Username column).
Already has an account · will be enrolled	The email already exists on the platform: no account is created, the existing one is enrolled and receives a welcome email with the course link. That account does not belong to the manager: its email and username are not corrected from here (only the ID document, with an audit trail).
Invalid DNI/NIE (check letter mismatch)	Only with the "Spain" check: the control letter does not match. The row is blocked until it is corrected.
Passport / foreign document (accepted)	Only with the "Spain" check: it is not a DNI/NIE, so it is accepted as it is, with an informative notice.
Group to be created	That group does not exist yet: it will be created on confirming. A typo ("group A" vs "Group A") shows up here, before anything is created.
Username collision	New email but the username is already taken: the row is blocked, with a copyable incident text to send to support with all the details.
These details do not allow the sign-up to be completed	Identity protection: the email already has an account but with **a different ID document** in its profile, or that **ID document already belongs to another account**. The plugin never overwrites or duplicates an identity: the row is blocked, with an incident text for the administrator (only with the data you typed; nothing from the other account). If the existing account had no ID document, it is filled in and enrolled as usual.
Duplicated in this list	Same email or same ID document as a previous row of the list: only the first one goes in.
Was removed from this course · will be readmitted	Restores the enrolment of a removed student (§10). With cumulative seats it consumes no new seat.
No seats available	The row exceeds the classroom's seat limit (§12).
The access end is not after its start	The period of that row is the wrong way round: fix it with the pencil before confirming.

Additional profile data

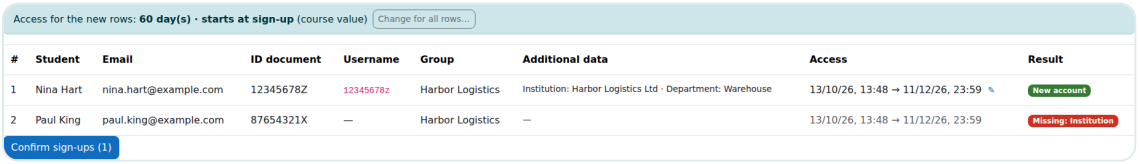

Besides first name, surname, email, ID document and group, the sign-up can collect **more profile data**: standard Moodle™ fields (institution, department, phone, mobile phone, city, country, address) and **custom profile fields** of type text, menu, checkbox or date. None is asked for by default: whoever configures the seats

chooses which ones and **which are mandatory**, in the site settings (for every course) or in each course's **Sign-up configuration**.

- They are written **after the group**, in the order the sign-up page shows, for example: `First name; Surname; Email; ID document; Group; Institution; Department` . If a student has no group, leave its place empty: `...; ID document; ; Institution` .
- The preview adds the **"Additional data"** column and blocks the row if a mandatory piece of data is missing or a value is not valid: a menu must match one of its options, checkboxes take yes / no, dates go as dd/mm/yyyy or yyyy-mm-dd and the country as its name or its two-letter code.
- In an **account that already exists** only what is empty is filled in: what the person already had in their profile is never overwritten.
- In **"My students"** this data appears under the name, **read-only**, and as columns in the export. It is only shown for accounts created by the sign-up in that course: the profile of an account that already existed is not shown to the manager. To correct a piece of data, the student changes it in their profile, or the administrator does.

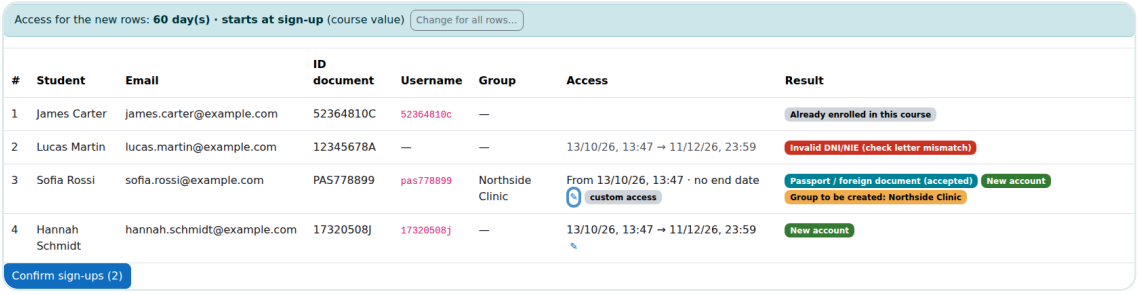

The boxes show which data this course asks for after the group and which are mandatory; the example already includes them.

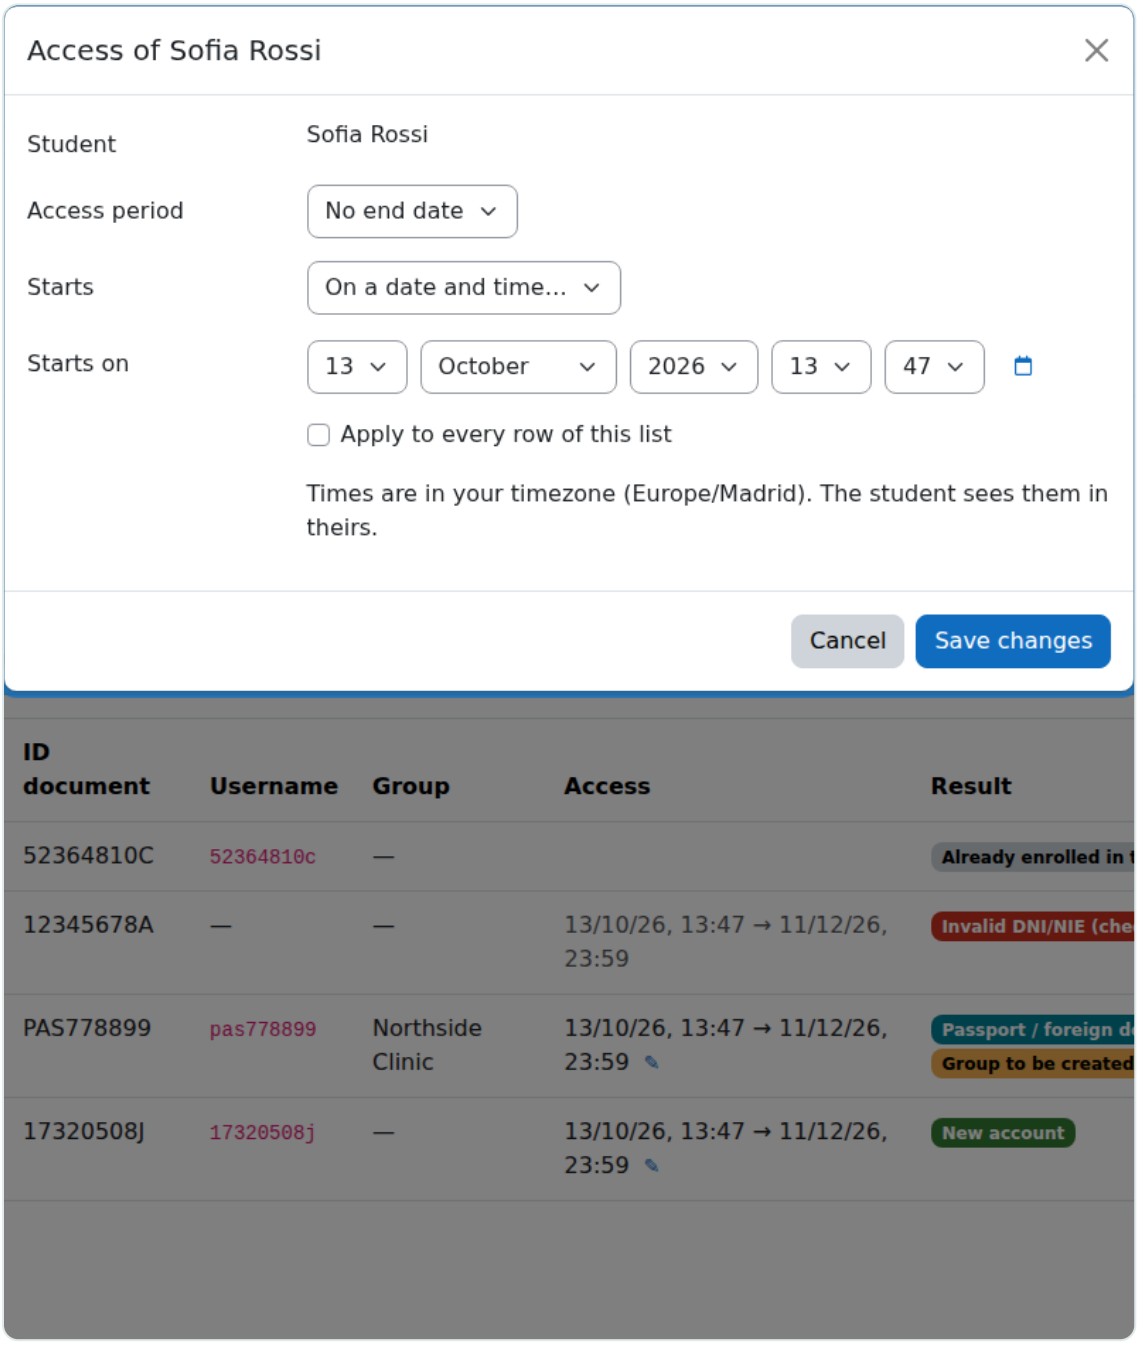

Row 1 is correct, with its additional data; row 2 is blocked because the mandatory data (Institution) is missing. A value that is not one of a menu's options is blocked in the same way.

The access of each row

The **Access** column arrives already filled with the course value (§5). Above the table you can see which rule is being applied and a **"Change for all rows..."** button. The pencil ✎ of each row opens a dialogue to give that person their own period: some with no end, others with 10 days, others with fixed dates, all in the same batch.

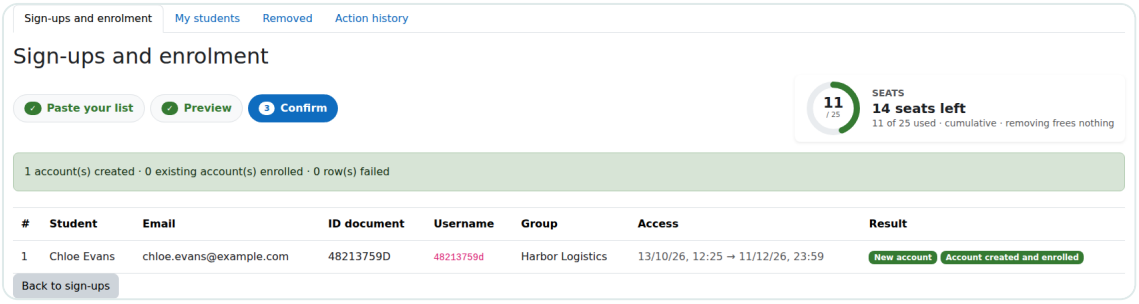

Row 3 with “custom access” (a set start, no end date); row 2 blocked by an invalid DNI/NIE; row 1 is already enrolled, so it gets no new period.

The pencil dialogue. “Apply to every row of this list” saves going one by one. Nothing is saved until you confirm: the server recalculates every period at that moment.

7 Confirming the sign-ups

Confirm sign-ups (N) runs only the valid rows — each one separately: if one fails, the rest carry on. For each student: account created (or linked), ID document written to the profile, enrolment, group and welcome email queued. Everything is recorded in the history (§11).

The summary says exactly what happened: accounts created, existing accounts enrolled and rows that failed.

> **REPEATING DOES NOT DUPLICATE**
>
> If the manager pastes the same list again and confirms once more, the students already enrolled show as “Already enrolled in this course” and nothing is touched.

Groups created automatically have no sheet

If a row names a group that does not exist, by default it is created. After confirming, a notice lists the **new groups** and reminds you that they are born **without a sheet** (dates, tutor, company): until it is filled in, reports use the course data. The notice carries the link to fill it in (“Fill in the sheet of the group” when local_efreport and its group sheet are installed; otherwise Moodle’s “Edit the group”).

The **groups policy** can also be set **per course** (Sign-up configuration → Groups): create the missing ones, or require the group to exist and block the row if it does not.

8 The welcome email and the queue

SIGN-UPS WITHOUT A WELCOME EMAIL

For clients who tell their students by other means, or students who already have their password: in the site settings, or in each course's **Sign-up configuration → Welcome email**, choose **"No: sign up without sending any email"**. Accounts are created and enrolled the same, and the panel marks them "Not sent (switched off)". New accounts are left without a known password: the student creates it with "Forgotten your password?", or you send the welcome email to whoever needs it with "Resend welcome" in the panel.

WHERE REPLIES GO: "REPLY-TO"

Welcome emails are always sent from the site's no-reply sender: a single, controlled sender for every course. If you want students' replies to reach a mailbox, enter it in **"Reply-to address of the welcome emails"**: in the site settings (for every course) or in a course's **Sign-up configuration → Welcome email** (for example, the mailbox that handles that client's sign-ups). Only whoever configures the course seats can change it, not the class manager. Empty, there is no reply-to address.

THE SUPPORT BLOCK AND THE SIGN-OFF

At the end of each welcome email come "Any trouble getting in, or any question? Write to **{support}** with your name and the course", an optional **support sentence** (hours, phone) and the **sign-off**. All three are set in the site settings and, if a client wants their own, in **Sign-up configuration → Welcome email** of their course. The support address follows a chain: the course's → the site's → the course "Reply-to" → and if there is none, that line is left out.

Two templates, with placeholders

Template	When	What it contains
A · New account	Newly created student	Their username and a **single-use link** that lands on "create your password" (Mode A) or their initial password (Mode B)
B · Existing account	Already had an account on the platform	The course name, the **direct link to the course**, their username as a reminder and the "Forgotten your password?" route

The placeholders are written exactly as below (the plugin replaces them with each student's data). Each one also has a Spanish name that works the same way ({nombre}, {curso}, {enlace}…), so templates written in Spanish keep working.

Placeholder	Replaced with
{firstname} · {lastname}	First name · surname
{course}	Course name
{username}	Username
{link}	Create-password link (template A) or course link (template B)
{password}	Initial password (Mode B only)
{centre} · {company}	Training centre · company
{startdate} · {enddate}	Course start date · course end date
{tutor}	Tutor
{support} · {supporttext} · {signoff}	Support address · support sentence · sign-off (see above)
{accessstart} · {accessend}	The student's own access period, with time, in their timezone; empty if they have none
{accessnotice}	Access notice: only when the student's access starts **after** the sign-up does it insert "Your access to the course starts on …" (text editable in the site settings); if the access is already open, it is empty

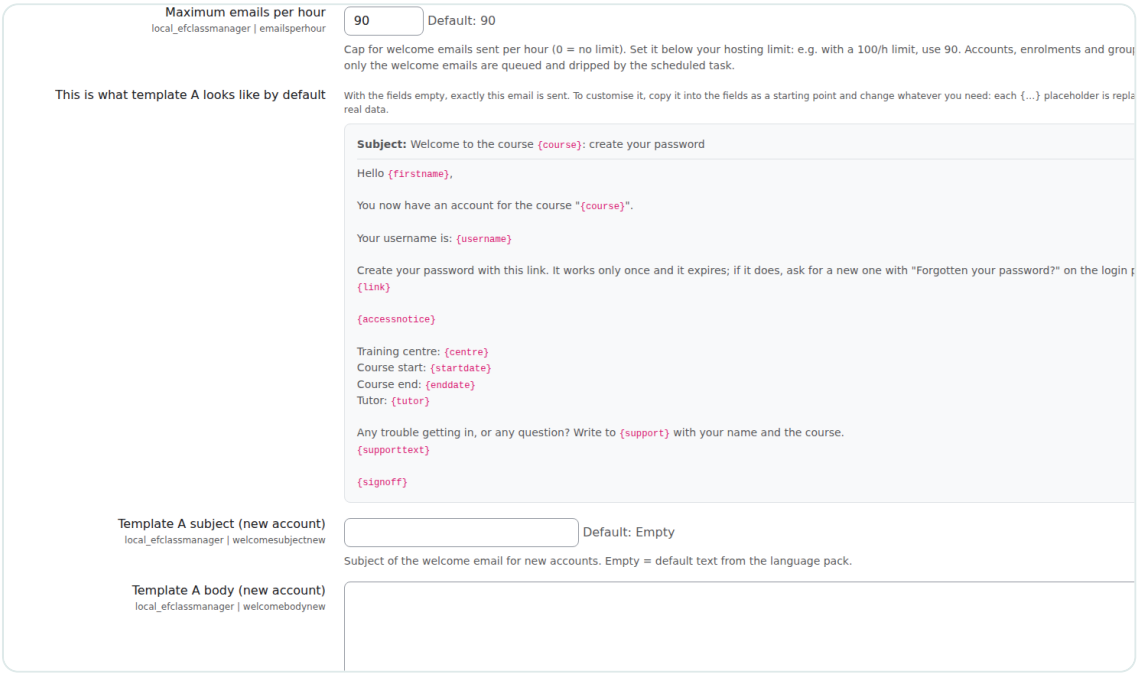

LINES WITHOUT DATA DISAPPEAR ON THEIR OWN

If all the placeholders of a line are empty (a course without a tutor or a training centre, an access that is already open), that line is left out of the email: a "Tutor:" with nothing after it never goes out. Lines without placeholders, or with some value, are sent as they are.

{centre}, {company}, {startdate}, {enddate} and {tutor} are read from the custom fields used by the eLearning Fácil suite (centro_formacion , empresa , fecha_inicio , fecha_final , tutor ; the short names can be changed in the site settings). If a field does not exist or is empty, the placeholder is empty.

ALWAYS WITH AN EXAMPLE IN FRONT OF YOU

Next to the fields of each template (in the site settings and in the course configuration) you will see the **real default email** drawn as a mini email, with the placeholders highlighted: exactly what is sent if you leave the fields empty. To customise it, **copy it as a starting point** and change whatever you need — nothing to memorise.

The visual example above the fields of template A: the default email with the placeholders highlighted, ready to copy.

TRAINING CENTRE AND COMPANY

`{centre}` is the course's **training centre** (who delivers the training) and `{company}` the student's **company**. If you use the group sheet of local_efreport, the company comes from the student's group; otherwise, from the course.

The queue: accounts instantly, emails in a steady trickle

- On confirming, **accounts, enrolments and groups are created immediately**. Only the welcome email goes into the queue.
- A scheduled task (every 5 minutes) sends them respecting the site's **maximum emails per hour**. The panel shows the status of each welcome email: **Queued · Sent (with date) · Send failed**.
- If the mail server rejects a send, it is retried automatically (3 attempts with waits of 5 min, 30 min and 2 h) and then stays as "Send failed", with the **Resend welcome** button for a manual retry.

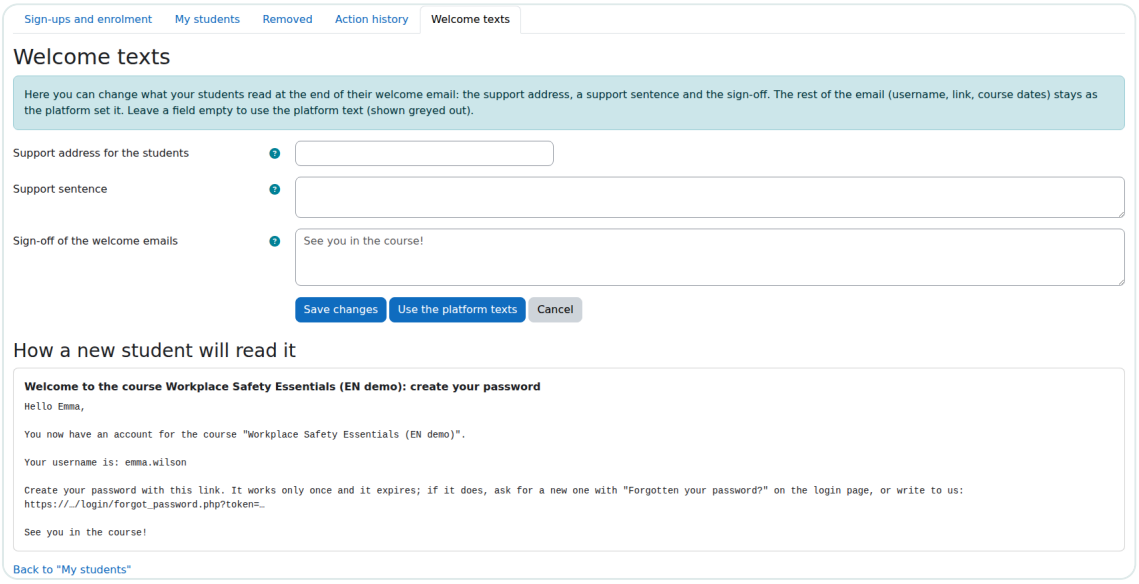

BEING HONEST ABOUT BOUNCES

A non-existent mailbox that "bounces" hours later **cannot be detected** on shared hosting. The panel gives it away: a student showing "No access · N days" with the welcome email sent is almost always a mistyped email. The manager corrects it and resends — without going through support.

What the class manager can change: "Welcome texts"

If you want a client to use their own tone without going through you, give them the `local/efclassmanager:customisewelcome` capability (it is not in the default "Class manager" role, only in Manager: give it to the clients who should have it, in the role or only in their course). With it, a **Welcome texts** tab appears in "My students", where they change **only three things** for their course: the support address, the support

sentence and the sign-off. Plain, short text **without links** (the form rejects them). The username, the password link and the dates are not touched: they stay as the platform set them.

The manager's page: the three fields (empty = the platform text, greyed out), "Use the platform texts" to go back and, below, how a new student will read the email.

- Every change is recorded in the course **history** ("Welcome texts changed", with who and when).
- If you prefer nobody to touch them in a course (for example, texts agreed with the client), tick **"Do not let the class manager change these texts"** in Sign-up configuration: the tab disappears for them.
- These three course texts apply even if the course "uses the site values" for everything else.

9 Accounts locked for changes: what can be corrected and when

An account created by the manager can be corrected **as long as the student has never logged in** to the platform. On their first login, the account becomes **locked for changes** (padlock in the panel): from then on the identity belongs to the student, not to the manager.

Correction	Before the first login	After (locked for changes)
Email	Yes (the manager)	No — the student changes it from their profile
ID document	Yes (regenerates the username)	Yes, with an audit trail (the username is kept)
Username	Regenerated automatically on correction	Never: it is a historical credential
Resend welcome	Yes (create-password link)	Yes (becomes a course link)
Access period	Yes	Yes
Suspend / reactivate / remove	Yes	Yes

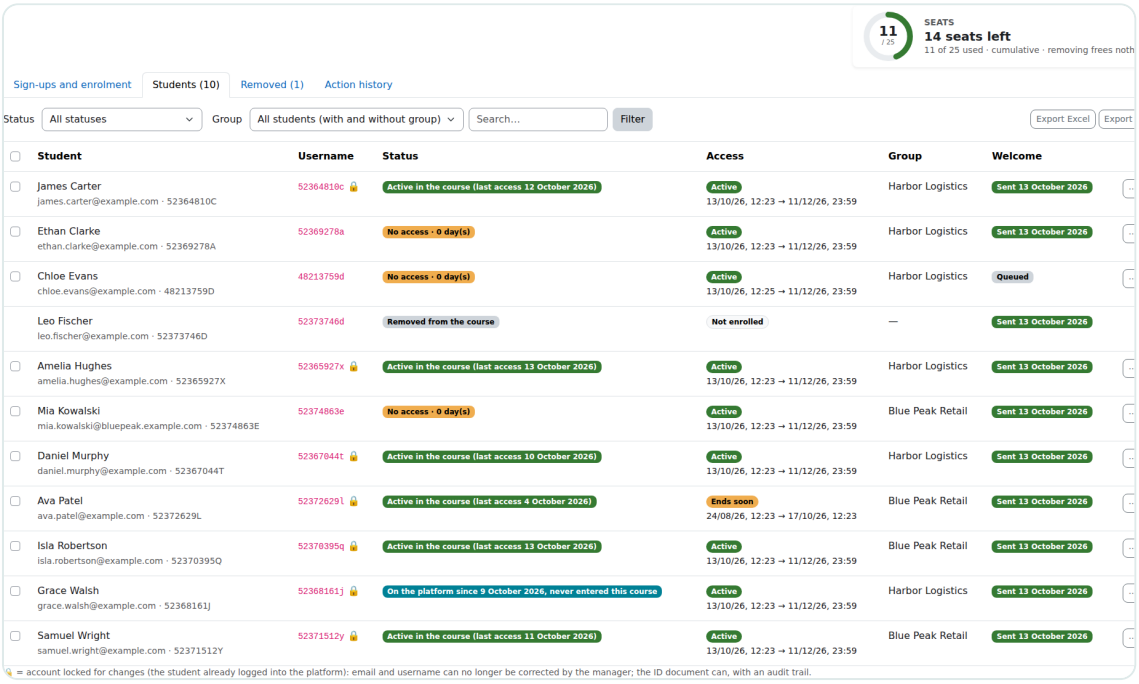

THE ID DOCUMENT BELONGS TO THE ACCOUNT, NOT THE COURSE

A student may be in courses for several companies. That is why the "Correct ID document" dialogue always warns that the change applies to the whole platform and shows the current value, and the correction is audited with the previous value. It never says "which other courses they are in": that would reveal third-party data. Recommendation: lock the ID document profile field so the student cannot edit it; the manager can still correct it from the panel.

What if the email of a locked account has to change? The student does it from Edit profile (Moodle™ asks them to confirm the new address), or the site administrator does it from the list of users. Not the class manager, for security: whoever controls the email controls the account.

10 The "My students" panel

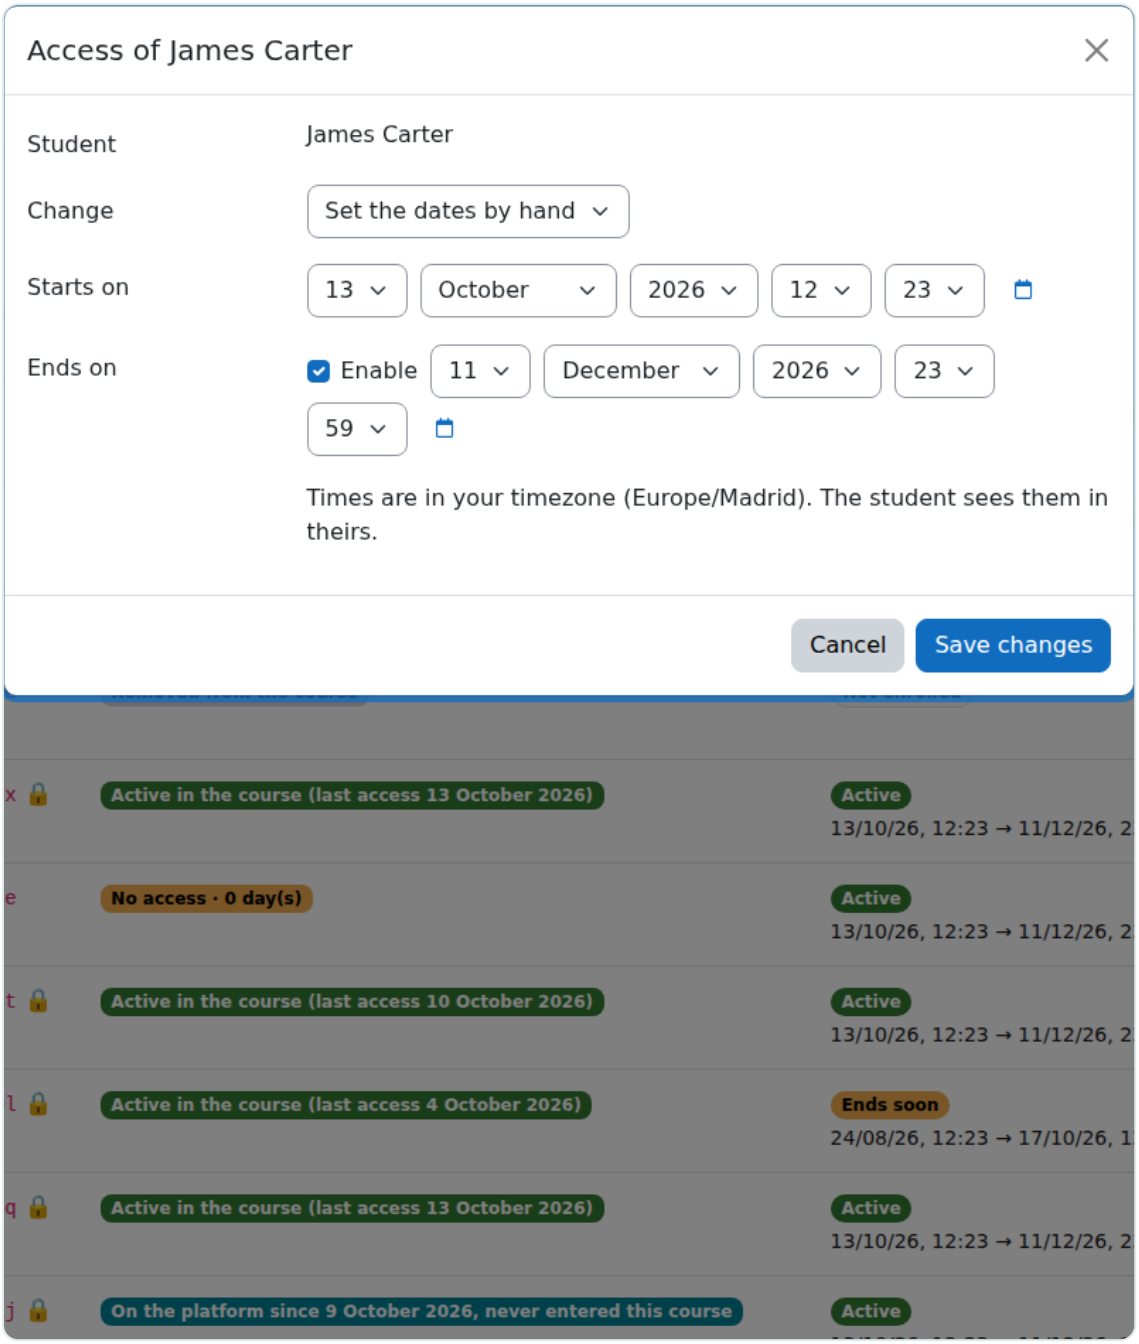

In the course: **More → My students**. All the manager's pages carry the same tabs at the top, to move back and forth with one click: **Sign-ups and enrolment**, **Students**, **Removed**, **Action history** and, if they have the capability, **Welcome texts**. "Students" lists **every student in the classroom**: those signed up through the plugin and those enrolled some other way, with the **"External enrolment"** chip.

Two status columns. **Status** (follow-up) comes only from Moodle™ data: **No access · N days** (amber; red from the threshold on — probably a wrong email), **On the platform, never entered this course** and **Active in the course**. **Access** comes from the enrolment: **Pending** (not started yet), **Active**, **Ends soon** (fewer than N days, configurable), **Ended** (still enrolled and in the reports) and **Suspended**. The padlock marks the accounts locked for changes.

The ··· menu of each row

- **Edit access**: extend or shorten that student's period, with time of day. Shortcuts: +7 days, +30 days, until the course end, no end date, or the dates by hand. It is recorded in the history with who and when.
- **Correct ID document** (for any student, including external enrolments; never another account's document) and **Correct email** (only accounts created by the sign-up and not yet locked for changes; an account that already existed is not touched).
- **Resend welcome**, **Suspend / Reactivate** (no reason needed; reversed with one click).
- **Remove from course** asks for a **mandatory reason**. The account is never deleted and its evidence is kept.
- Suspend, reactivate and remove only exist for **manual enrolment**: a student who came in through self enrolment, a cohort or another method is managed from that method, and the menu does not offer them.

"Edit access": choose a shortcut or set the dates by hand. If the student is enrolled through another method (self enrolment, cohort…), the access is shown but changed there.

Bulk actions

Tick several rows and a bar appears: **Set end…**, **Add days…**, **No end date**, resend welcome, suspend, reactivate (these three ask for confirmation with the number selected) and remove (with a reason). If anyone in the selection is not a student of the course, nothing is done and you are warned; students without a manual enrolment are skipped and the final notice tells you how many. When it finishes you return to the panel with the same filters.

The "Removed" tab

Who was removed, when, by whom and why, with their username, email and group at the time. It can be exported to Excel and CSV. The **"Sign up again"** button takes you to the sign-up page with their line already written: the account's current name, email and ID document, the group they were in and, if the plugin created

the account, the additional data the course asks for (read from their profile). The preview will say “Was removed from this course · will be readmitted”, restore the enrolment (with the period you choose), resend the existing-account welcome email, restart the “No access” day count from that moment and record it all. If the account is deleted from Moodle™, the row is anonymised (“Deleted account”) but the seat keeps counting in cumulative mode (one seat per person, even if they were removed several times). If the course is **reset** unenrolling the **students** (“Unenrol users” with the student role ticked), the course sign-ups and removed students are cleared and the seats start from zero; a reset that unenrols nobody, or only teachers, changes nothing.

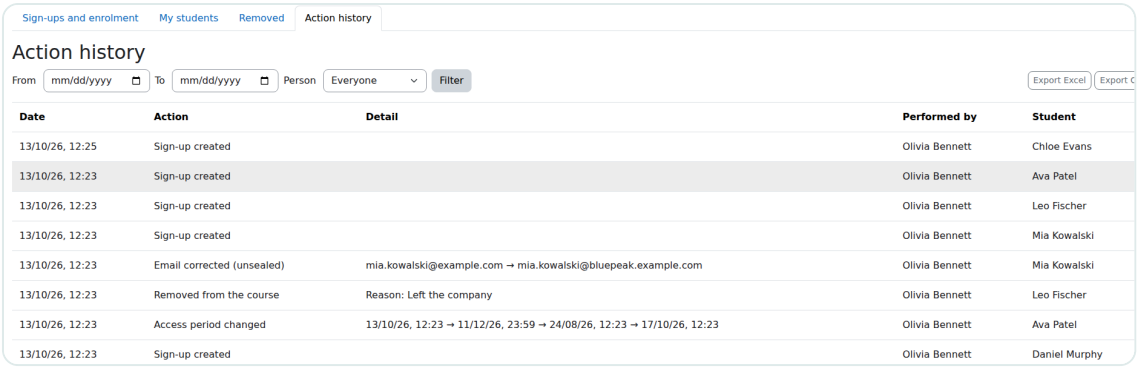

- **Filters** by follow-up or access status, by **group** (all students, no group or a specific group) and free search (name, email, ID document, username).
- **Export Excel/CSV** with the visible columns (Access included), respecting the filters, with the course identification block and the “Generated on…” line.
- Suspending does **not** free a seat; removing only frees it in concurrent mode (§12).

WHAT HAPPENS WHEN THE END DATE ARRIVES

Moodle™ handles it on its own: the student can no longer get in, but **stays enrolled and stays in the reports** of the eLearning Fácil suite (like a suspended student). For this, in the course’s Manual enrolments instance leave **Enrolment expiry action** on **“Keep user enrolled”** (the default): with “Unenrol user from course” they would disappear from the reports. There you can also turn on **Notify before enrolment expires** so that Moodle™ warns the student.

11 The action history

In the course: **More → Action history**. Every action of the manager leaves a trace: sign-ups, linked accounts, email and ID document corrections, access period changes, resends, suspensions, removals, groups created, attempts without seats, collisions detected and every time the administrator saves the course's sign-up configuration. The **Detail** column says what the action changed: the reason for a removal, the old and new value of an email, an ID document or an access period, the group created or how many rows were left without a seat.

Date	Action	Detail	Performed by	Student
13/10/26, 12:25	Sign-up created		Olivia Bennett	Chloe Evans
13/10/26, 12:23	Sign-up created		Olivia Bennett	Ava Patel
13/10/26, 12:23	Sign-up created		Olivia Bennett	Leo Fischer
13/10/26, 12:23	Sign-up created		Olivia Bennett	Mia Kowalski
13/10/26, 12:23	Email corrected (unsealed)	mia.kowalski@example.com → mia.kowalski@bluepeak.example.com	Olivia Bennett	Mia Kowalski
13/10/26, 12:23	Removed from the course	Reason: Left the company	Olivia Bennett	Leo Fischer
13/10/26, 12:23	Access period changed	13/10/26, 12:23 → 11/12/26, 23:59 → 24/08/26, 12:23 → 17/10/26, 12:23	Olivia Bennett	Ava Patel
13/10/26, 12:23	Sign-up created		Olivia Bennett	Daniel Murphy

It can be filtered by period and by person (whoever appears in the course history) and exported to Excel/CSV with the same identification block and the same detail column. The screen shows the latest 500 actions (with a notice if there are more); the export carries them all. The manager sees their own course's history; the administrator, every course's.

REFERENCE

The ground rules

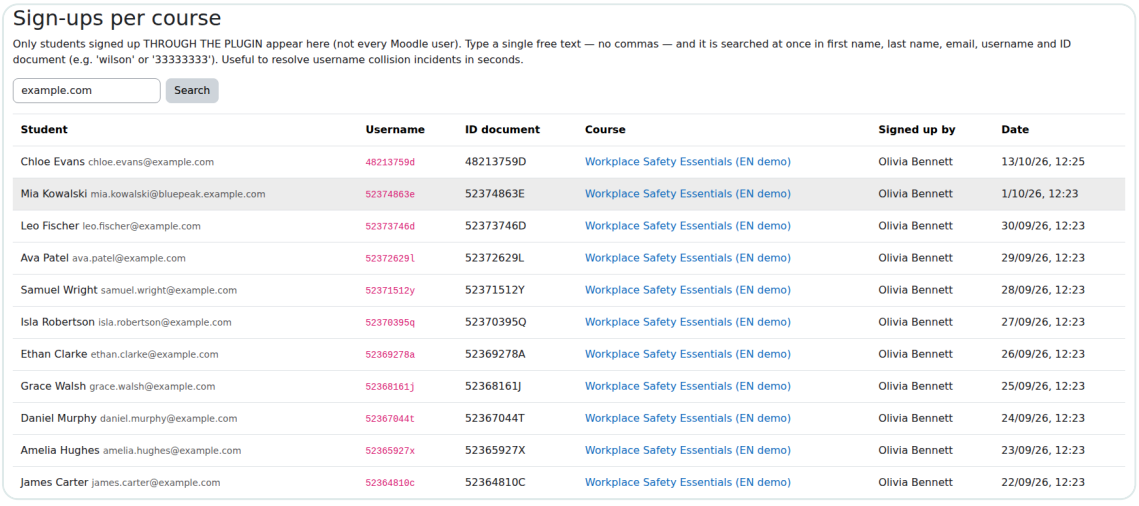

Seats, administration, permissions and backups — what is worth keeping at hand.

12 Seats

- Two modes, per course (§5). **Cumulative** (default): every student signed up consumes a seat for good; removing frees nothing; readmitting the same person consumes no new seat; if their account is deleted, the seat keeps counting. **Concurrent**: active **and suspended** student enrolments count; removing frees the seat. In both, teachers and inspectors consume nothing.
- The preview warns about the rows that exceed the limit; the real enforcement happens **on the server** on confirming. The attempt is recorded in the history.
- Message to a manager with no seats left: “No seats left. Contact your provider to extend the seats.” — your commercial signal to extend the contract.

13 “Sign-ups per course” (administration)

In **Site administration → Plugins → Local plugins → Sign-ups per course**: the administrator’s global search. Without a search it shows the latest sign-ups; typing **a single text** (no commas) searches first name, surname, email, username and ID document at once.

Who was signed up, in which course, by whom and when: a collision incident that a manager pastes to you by email is resolved here in seconds.

14 Permissions

Capability	Who has it	What it allows
local/efclassmanager:manage	Class manager	Sign-up page and “My students” panel
local/efclassmanager:viewhistory	Class manager	Their course’s history
local/efclassmanager:customisewelcome	Manager / administrator; you grant it to the Class manager	“Welcome texts” of their course: support address and sentence, sign-off (§8). The administrator can lock it per course.
local/efclassmanager:configure	Manager / administrator	The course’s sign-up configuration: seats, access, groups, additional data and welcome email

An auditor or inspector needs nothing from this plugin: the evidence they care about (time, communications) is in the reports of the other eLearning Fácil plugins.

15 Backups and integrity

- The **course configuration** (seats and their mode, access, groups, additional data, welcome email and templates) **always** travels in the backup. The **site settings** do not: set them the same on the target site.
- The **sign-ups** (with their access period) travel only with “Include enrolled users”, remapped to the target; users that cannot be mapped are skipped (an auditable criterion). The enrolment dates themselves are carried by Moodle™ with the users.
- The **list of removed students** travels with the users; those that do not exist on the target are kept anonymised so that the cumulative seat count does not drop.
- An **anonymised** backup (the core “Anonymize user information” option) carries no ID document, generated username or names of removed students: the seats and the dates, yes.
- A pending welcome email is restored as “Send failed”: **a restore never sends emails**. The manager can resend it on purpose.
- Restoring twice does not duplicate. The history (events) travels with “Include course logs”.
- **File integrity check** in System status (installations from the ZIP).

When a course is deleted, the sign-ups and the configuration of that course are removed automatically: a clean deletion, with no orphaned data in the database.

16 Frequently asked questions

What if the manager mistypes an email?

The student will receive nothing and the panel will show “No access · N days” (red from the threshold on). The manager corrects the email and clicks “Resend welcome”. No support tickets.

What if the student already had an account from an earlier course?

Their usual account is enrolled and receives template B with the course link and their username as a reminder. The manager only sees a neutral message ("Already has an account · will be enrolled"): never where it comes from or which other courses they are in. And that account is not theirs: they cannot change its email or username (whether the student has logged in or not), only the ID document, with an audit trail. If that account's email is dead, it is an incident for the administrator.

Does the create-password link expire?

Yes, according to the site's `pwresettime` (30 min by default; we recommend raising it, §3). If it expires, the page itself offers to request another one, and the manager can always resend the welcome email.

Can the manager suspend the tutor?

No: enrolment actions only work on users with the student role. Tutors and inspectors are out of their reach.

Why can I not correct an email?

The account is already locked for changes (the student has logged in at least once). From then on the email is changed by the student from their profile; if their old mailbox is gone and they cannot confirm, it is an incident for the administrator.

17 More plugins by eLearning Fácil

Class Manager handles the sign-ups. For everything that comes after —measuring, documenting and delivering the training— we have a family of plugins that work the same way, together or separately:

Training reports and evidence

The evidence of the training, ready for an audit. A time and progress report with a reliable clock (inactivity, period, assessment checks), a report of communications with the tutor, a course dossier in a ZIP you can archive, a block with links to the reports and access to activities by time spent. With a sheet per group for several companies or cohorts in one course.

Also in the suite

Engagement alerts to the student and the tutor (not started, drop-out, final stretch, checks, certificate deadline); **Course ready**, a checklist that confirms that the course is ready before it starts; and **My progress**, the block where each student sees their time and what they have left.

Active Time Clock (free)

Measures the real connection time of each student in the course. It is the way in: if you later install the full reports, everything measured is kept.

Bulk certificate manager

Issues and downloads a course's certificates in one go, with filters for who qualifies, and keeps a record of the delivery.
